What we are building

A web tool for investor firms to assess the ESG risk of the companies they invest in. The user describes the company, answers questions about how well it is managed, and receives a residual-risk score with required actions and a human review workflow.

Completed

- **Framework universe.** All 11 SASB sectors and 77 industries mapped, sourced from the SASB Standards rather than invented. This determines which topics matter for which business, and drives every downstream score.
- **Scoring model.** Residual risk equals exposure adjusted for management maturity (policy, measurement, targets, independent verification). Exposure blends across industries, so multi-business groups can be modelled by revenue share.
- **Working application.** Portfolio dashboard, sector-specific questionnaires, live scoring, priority actions, and an enforced review workflow where the approver must differ from the reviewer and every change is logged.
- **Industry-level weighting (Step 2).** All 77 industries now carry their own topic weightings, so the industry a company is assigned drives its exposure. Multi-business groups blend across industries by revenue share.
- **Verified universe.** All 77 industry codes and 12 topic mappings checked against the SASB codification and GRI standards on 1 October 2026. 89 of 89 entries verified; the universe is no longer provisional.

Current limitation

- The industry weightings are reasoned, not sourced. The 924 values derive from sector base vectors and per-industry overrides rather than from SASB's published disclosure-topic list for each industry.
- The remaining task is to grade each industry from its published topic list — the same checking method that closed Step 1.

Future workflow

1 Evidence tiering

Score claimed, documented and verified evidence differently, instead of treating all answers as equal.

2 Backtesting

Test the model against companies with known ESG failures, and against well-regarded firms, to calibrate thresholds.

3 Persistence

Move data from browser storage to a server database with user accounts, for multi-user deployment.

Next decision

Nothing is blocking. Two candidate moves: verify the 924 weightings against each industry's published SASB topic list — the method that closed Step 1 — or proceed to Step 3 and return to weighting verification later.
